

Are You Accurately Dispensing & Monitoring Your Water & Wastewater Treatment Chemicals?

- **Safety** - Operator/Worker safety is protected by early detection of chemical exposure.
- **Accuracy** - Insure accurate tracking of chemical usage and inventory.
- **Regulatory Compliance** - Meet government and municipal regulations for safety and record keeping in the handling of water treatment chemicals.
- **Cost Savings** - Stop waste (overfeeding) of expensive chemicals through accurate feed rates.

Improper dispensing of water treatment chemicals (such as Liquid Fluoride, Sodium Hypochlorite, Ammonia, etc.) can cause big problems!

Too low dosage of water treatment chemicals will not protect drinking water adequately. Too high dosage could be unsafe and/or costly. Trips to well site chemical rooms to maintain a check on the correct usage are both labor intensive and very costly. The cost effective and safe answer is a total electronic scale weight system manufactured specifically for the water treatment industry by **SCALETRON INDUSTRIES, LTD.**

Scaletron scales coupled with a Scaletron indicator can provide the most accurate scale weights and automated reports from remote locations via a 4-20mA or RS232 output signal.
